

ABSTRACT

The present invention relates to a method of transmitting information using computer systems loaded with appropriate software. Such software may allow a method of transmitting
5 information through executing a series of steps, starting with the software receiving intended recipient information from a sender of information, and in turn also receiving details from a sender of a storage location within the sender's computer system at which information to be transmitted is stored. Such software can then transmit all the information stored within the sender's computer system at the storage location detailed to an intended recipient or recipient for
10 such information.
